### High Level Synthesis From Algorithm

This book presents an excellent collection of contributions addressing different aspects of high-level synthesis from both industry and academia. High-Level Synthesis: from Algorithm to Digital Circuit should be on each designer's and CAD developer's shelf, as well as on those of project managers who will soon embrace high level design and synthesis for all aspects of digital system design.

### High-Level Synthesis: from Algorithm to Digital Circuit ...

High-level synthesis (HLS), sometimes referred to as C synthesis, electronic system-level (ESL) synthesis, algorithmic synthesis, or behavioral synthesis, is an automated design process that interprets an algorithmic description of a desired behavior and creates digital hardware that implements that behavior. Synthesis begins with a high-level specification of the problem, where behavior is ...

### (PDF) High-Level Synthesis from Algorithm to Digital ...

Most computer algorithms today are developed in high-level languages on general-purpose computers. But someday they may be deployed in embedded systems where the development, verification, and validation of algorithms is done in languages like python, Java, C++, or even numerical frameworks like MatLab. This is the goal of high-level synthesis (HLS), and it aims to solve a fundamental problem in system design today.

### Improving Algorithms With High-Level Synthesis

High-level synthesis is an automated method of creating RTL designs from algorithmic descriptions. Within an ESL design method flow, we consider the following usage models of high-level synthesis: 1.

### High Level Synthesis - an overview | ScienceDirect Topics

High-Level Synthesis Implement algorithms in ASICs or FPGAs from high levels of abstraction High-level synthesis is the process of converting a high-abstraction-level description of a design to a register-transfer-level (RTL) description for input to traditional ASIC and FPGA implementation workflows.

### High-Level Synthesis - MATLAB & Simulink

Abstract - New algorithms for high-level synthesis are presented. The first performs scheduling under hardware resource constraints and improves on commonly used list scheduling techniques by making use of a global priority function.

## **Scheduling and Binding Algorithms for High-Level Synthesis**

The synthesis algorithm constructs a mediator in two main phases. During the first phase, an initial process A is created which represents all possible coordinations of components' behaviors that verify the ordering constraints imposed by the interface mapping. In the second phase, any execution in A leading to a deadlock is removed.

## **Synthesis Algorithm - an overview | ScienceDirect Topics**

Algorithms for high-level synthesis Abstract: Synthesis algorithms that offer a technique for scheduling operations and allocating registers and buses in light of both timing constraints and available hardware resources are presented.

## **Algorithms for high-level synthesis - IEEE Journals & Magazine**

This process can be simplified by using Catapult High-Level Synthesis (HLS) along with a sophisticated workflow. The model transformation from Simulink to class-based C++ is much simpler than transformation to RTL because the abstraction level can be kept almost the same and the design hierarchy can be taken from the Simulink model hierarchy.
