Transmission Lines And Lumped Circuits

[The time-domain analysis of networks composed of linear transmission lines and nonlinear and/or time-varying lumped circuits is at the basis of design and verification of modern high-speed electronic circuits and large power distribution systems. This book provides an in-depth and comprehensive study of time-domain models of these networks.

Publisher Summary. This chapter deals with the explanation of ideal multiconductor transmission lines. Ideal two-conductor transmission lines can be characterized as two-ports in the time domain, and their behavior can be represented through simple equivalent lumped circuits of Thévenin and Norton type.

The Lumped Element Circuit Model for Transmission Line [Telegrapher's Equations]

The majority of modern distributed-element circuits use planar transmission lines, especially those in mass-produced consumer items. There are several forms of planar line, but the kind known as microstrip is the most common. It can be manufactured by the same process as printed circuit boards and hence is cheap to make. It also lends itself to integration with lumped circuits on the same board.

Another example of the use of distributed elements is in the modelling of the base region of a bipolar junction transistor at high frequencies. The analysis of charge carriers crossing the base region is not accurate when the base region is simply treated as a lumped element. A more successful model is a simplified transmission line model which includes distributed bulk resistance of the base ...
